

BUILT ON STELLAR

Bounty rewards that cannot quietly vanish

The reward is locked in a Soroban escrow contract
before anyone starts work.

BountyFlow

SWIPE →

Paying for small work runs on trust

- Contributors deliver, then **wait or chase** for the money.
- Requesters pay up front and **hope** the work matches the brief.
- "Funded" is **a label in a database**, not money anyone can check.
- Cross-border payouts lose **3–7% to fees** and take days.

Escrow first, then work

Funded means funded

A bounty reads Funded only when the contract confirms it holds the reward.

Paid means paid

A payment reads Confirmed only when the contract reports the contributor as paid.

Refunds follow rules

A refund cannot bypass the contract, and there is no admin withdrawal.

Every step is a state

01 **Post**

02 **Fund escrow**

ON-CHAIN

03 **Apply and select**

04 **Submit and review**

05 **Payout**

ON-CHAIN

06 **Attestation**

The contributor is not stranded

The requester goes quiet

A contributor whose work is recorded on-chain can claim the reward once the review window closes.

The two sides disagree

A dispute freezes the escrow. An M-of-N arbiter set decides, and split outcomes are allowed.

Nobody holds your keys

Every transaction is signed in the user's own wallet. There is no admin withdrawal path.

Small work worth posting

~5s

Ledger close, so payout is near-immediate

<\$0.01

Network cost of an escrow operation

10–20%

What traditional platforms take per job

USDC

Or XLM, or any Stellar asset

Fees low enough that a **\$20 bounty still makes sense** to post.

WHAT IS LIVE TODAY

Running on Testnet

3

Soroban contracts deployed, full lifecycle proven on-chain

508

Automated tests: 417 backend, 91 contract

184

API endpoints across 22 modules

28

Documents, including 12 SRE runbooks

Mainnet is gated on an **independent contract audit**, by design.

NON-CUSTODIAL BY DESIGN

Work gets done. Rewards move transparently.

Open source, MIT licensed, and built by one person.
